## Indiana's Biomedical Industry Today (Part II)

In the second quarter of 1999, Indiana had 140 establishments that were primary producers of medical-and biotech-related products, with a combined employment of 27,117 workers. Employment in this industry accounts for less than 4% of Indiana's manufacturing workforce. Industry payrolls, however, amount to nearly 7% of total Indiana manufacturing payroll, with average weekly wages of \$1,304. These wages exceed the state average for all private employment by 135% and the state average for manufacturing by 68%.

### **The Medical Device Sector**

**in Detail:** The 1997 U.S. Economic Census permits a detailed look at the medical device sector of the medical and biotech industry. Unfortunately, data on the pharmaceutical sector is not available at this time due to confidentiality restrictions. The medical device sector is broken down under the new NAICS coding system (see sidebar description of NAICS) into eight product-related categories.

On first glance, the medical device sector may look weak in the high-skill, high-wage areas, but a closer look at the data suggests that medical devices is anything but a low-tech or low-wage sector. Surgical and medical instruments and surgical appliances and supplies dominate the sector. While instruments manufacturing is generally high-tech, the appliances and supplies sub-sector is often (but mistakenly) considered a low-technology, low-skill

The Indiana Biomedical Industry, Second Quarter, 1999				
Sectors	Establishments	Employment	Weekly Wage*	
Pharmaceuticals	27	15,873	\$1,611	
Other Medicinal	13	380	557	
Surgical Instruments	32	5,376	845	
Surgical Appliances	43	4,920	938	
Other Medical Equipment	17	459	809	
Ophthalmic Goods	8	109	490	
INDUSTRY TOTALS	140	27,117	\$1,304	
All Indiana Private Industries All Indiana Manufacturing	148,123	2,543,636	\$554	
Industries	9,879	690,261	\$774	

area in Indiana. In employment, the appliances and supplies sub-sector ranks fourth in the United States and in shipments/sales/receipts second nationally. Indiana also ranks second in average pay (\$42,448) and is among the leading states in productivity in this sub-sector. The data indicate, therefore, that rather than being lowtech, surgical appliances and supplies are high-value products produced by a highly skilled workforce. The electromedical sub-sector is another high-skill, high-wage element of medical devices. Unfortunately, the number of workers employed by the electromedical devices manufacturers is difficult to isolate. Most manufacturers of electromedical devices are primarily electronics manufacturers and classified as such. Given Indiana's large electrical and electronics industry, there is a considerable amount of hidden electromedical-related employment.

\* Wages reflect second quarter only. Annual wages may actually be higher as they will include wages for all quarters. First- and fourth-quarter wages often include one-time annual bonuses.

# NAICS

The North American Industry Classification System (NAICS) is replacing the U.S. Standard Industrial Classification (SIC) system. NAICS was developed jointly by the U.S., Canada, and Mexico to provide new comparability in statistics about business activity across North America. NAICS reflects the enormous changes in technology and in the growth and diversification of services that have marked recent decades. Indiana's combined medical device sector, led by surgical appliances and supplies, is a major player in the national scene. Indiana surgical appliances and supplies ranks 15th in the total number of establishments nationally but ranks 11th in employment. In annual average wages, Indiana ranks ninth at \$36,563, which is just under the national wage of \$36,839. Most importantly, Indiana ranks seventh in total shipments/sales/receipts.

#### **Trends in the Industry**

Overall, employment in Indiana's medical and biotech industry has declined by 1.1% between 1989 and 1998. However, in the two largest medical device sectors, employment has increased at twice the rate of the nation. Growth in these sectors began to slow in 1998 and into 1999 in Indiana. U.S. employment figures do not clearly indicate if this is a local or national trend. Employment in the pharmaceutical sector in Indiana has declined while U.S. employment has risen; this trend should reverse as Eli Lilly and Company begins its major expansion over the next decade. The aging of the U.S. population is a factor that leads most industry analysts to anticipate continuing growth in each sector of this industry.

### Indiana's Biomedical Future

Indiana, with its existing manufacturing base, research and educational facilities, and current public policy emphasis on high-technology business,

Indiana's Medical Device Sector					
				Shipments/	
			Payroll	Sales/Receipts	
Classifications & Industry Data	Establishments	Employment	(\$000)	(\$000)

is in a position to see further growth in the medical and biotech industry. In addition to the well-broadcast expansion of Eli Lilly and other similar companies, efforts are underway to stimulate new ventures and entrepreneurialism in this industry. These efforts include the 21st Century Research and Technology Fund established by the State of Indiana to leverage federal research dollars, support technology transfer and stimulate new private-sector research. The state legislature has appropriated \$50 million to the Fund for the 1999-2001 biennium. The state's two major research universities, Indiana University and Purdue University, also attract approximately \$350 million in federal research grants each year. Of that amount, \$200 million goes to research related to the biomedical and medical industry. Industry leaders including Clarian Health, Eli Lilly, Roche Diagnostics and Dow AgroSciences joined with the state's research universities and the City of Indianapolis to form the MedAmerica Research Corridor. The purpose

of this statewide collaboration is to attract and nurture new biomedical companies interested in locating in central Indiana.

Nevertheless, risks to the industry's future growth also exist in Indiana. Because this is a targeted industry, heavy competition between states for new operations and expansions will be intense. At the same time, rising medical costs may place pressure on producers to reduce costs through employment cutbacks or relocations outside the U.S., where labor is less expensive. Even positive situations might cause short-term difficulties as companies compete for labor in a tight market.

By Ted Jockel and Leslie Richardson, Indiana Department of Commerce.
